EXECUTIVE SUMMARY

This energy efficiency study determined the demand reduction and energy savings of 12 vertical sash, variable air volume fume hoods. The assessment compared the volumetric air flow rates of fume hoods with and without automated sash positioning control systems (ASPCS). Twelve hoods were studied: 6 hoods with automated sash positioning control systems and six without this sash control system at Amgen Laboratories. Amgen is a large biotechnology company with 651 fume hoods in operation at its Thousand Oaks, California headquarters facility.

FUME HOOD EXHAUST AND MAKE-UP AIR DEMAND AND ENERGY SAVINGS

This project established load profiles for the fume hoods with and without automated sash positioning control systems. The study measured the exhaust air quantity flowing through each monitored fume hood. The assessment compared the difference in exhaust from the hood and makeup air to the hood examining six fume hoods with automated sash positioning control systems (ASPCS) and six without the automated sash positioning controls. Results were based on a 14-day airflow monitoring schedule which was conducted 24-hours a day using the building maintenance system (BMS). This system is located in Amgen Building 29 in Thousand Oaks in Climate Zone 9.

To correlate these findings with equipment located in other California climate zones, the airflow data collected at the Amgen site was used to generate load profiles. Using performance data from Amgen's existing central plant and HVAC systems, load profiles were generated with Trace 700 computer simulations. Central plant equipment includes chillers, pumps, and boilers. Southern California Edison Company and Southern California Gas Company rate structures were used for 16 climate zones in California to determine variability in demand and energy savings at different geographic locations throughout the state.

Two sets of data had to be collected at different time periods because the first set was not valid. The first data set was collected from November 8, 2006 to November 22, 2006, but, unfortunately, it was not representative due to unexpected obstructions in the direct path of the automatic sash hoods, such as empty bottles and buckets. This data was discarded since it was erroneous and showed very little difference in airflow rates.

After corrective measures including removal of obstructions were made at the affected test hoods, the second set of data was collected between March 26, 2007 and April 9, 2007. Monitoring results showed averages of 296-554 cfm difference between ASPCS and non ASPCS hoods. During the second set of data, daily walk through inspections of the test hoods was undertaken to verify proper operation of hoods with ASPCS and without ASPCS hoods.

Table 1 compares the findings of annual kWh savings and kW demand reductions of hoods with ASPCS with hoods without ASPCS hoods for 16 California climate zones.

The average energy cost of all 16 climate zones was \$6.41 per cfm per yr. At Amgen, in Thousand Oaks, climate zone 9, the cost per cfm per yr. with ASPCS was \$6.20. The average daily cfm usage from the six test hoods with ASPCS was 1960 cfm. The average daily cfm usage from the six test hoods without ASPCS was 4622 cfm. This represented a 58% reduction in daily airflow cfm use.

Simulations showed a combined total electric and gas cost reduction of \$15,106 per year for the six hoods with the automated sash positioning control system. When the installation costs of approximately \$27,000 for the six ASPCS units are divided by the difference in utility costs (\$15,106), a cost benefit ratio of 1.79 years is achieved.

The kWh savings were 102,872 kWh for the six hoods in Region 9. (185,017 kWh with ASPCS versus 82,145 kWh without ASPCS). Each sash hood with an ASPCS installed would save approximately 17,145 kWh per year. If Amgen installed ASPCS on every vertical sash hood (150 hoods), would result in potential savings of 2,571,750 kWh/year or approximately \$377,650/year.

INTRODUCTION

This energy efficiency study was undertaken to determine the demand reduction and energy savings of fume hoods with and without automated sash positioning control systems (ASPCS). All fume hoods were vertical sash configurations with variable air volume (VAV) systems. Amgen, a large biotechnology firm headquartered in Thousand Oaks, operates 651 fume hoods, including bench top and walk-in systems. Three hundred fifty-one run on VAV, of which 150 have vertical sash and can be readily retrofitted with ASPCS. The fume hood market is large and homogenous and not sector dependent, according to Lawrence Berkeley Laboratories, with at least 85,000 operating in California. For this reason, it offers exceptional opportunities for energy and demand savings.

FUME HOOD OPERATION AND COMPONENT BREAKDOWN

A fume hood is a partially enclosed laboratory workspace designed to capture toxic, irritating or unpleasant vapors and gases before they enter the breathing zone. A negative pressure is maintained inside the hood to prevent toxic substances from escaping the hood. A bench top fume hood with an automated sash positioning control system is shown in Figure 1.

A typical fume hood has these main components:

- A hood body, or the visible part of the chemical hood, which contains gases and vapors.
- Baffles or moveable partitions in the hood body which control airflow and keep it uniform across the hood opening.
- The sash, or sliding door to the hood, is positioned to maximize capture of airflow contaminants when the system is in use. With an automated sash positioning control system (ASPCS), the sash is lowered to a minimum or closed when no one is working in the fume hood area of the lab bench. An airfoil, located along the bottom and side edges of the fume hood, streamlines airflow into the hood to prevent vapors from escaping.
- Work surface
- Exhaust plenum helps evenly distribute airflow across the hood face.

TYPICAL ASPCS COMPONENTS

A typical automated sash positioning control system has the following components:

- Infrared sensor is used to detect the presence of a user in the vicinity of the hood.
- Auto/Manual Selector Switch enables a user to manually override the automatic sash control system.

- Two manual push buttons are used to set the height of the sash.
- On walk-in style hoods, there is a floor level lower limit switch which detects if an object is obstructing the path of the sash.

FIGURE 1. FUME HOOD WITH AUTOMATED SASH POSITIONING CONTROL SYSTEM.

AUTOMATED SASH POSITIONING CONTROL SYSTEM

An automated sash positioning control system (ASPCS) is a device that opens and closes a fume hood sash when it detects that personnel are present. Each hood has an auto/manual selector switch and two manual push buttons as shown in Figure 2. The system uses a cable cylinder to move the sash up to an open or down to a closed position, as shown in Figure 3. Air lines activate the cable/pulley system as shown in Figure 4. The system also has an IR eye and reflector for object detection. (Figure 5)

FIGURE 2. A USER CAN SWITCH TO MANUAL MODE AND USE THE PUSH BUTTONS TO RAISE AND LOWER THE FUME HOOD SASH.

FIGURE 3. THE CABLE/PULLEY SYSTEM ON TOP OF EACH FUME HOOD IS USED TO OPEN AND CLOSE THE SASH TO THE CORRECT, PREDETERMINED HEIGHT.

FIGURE 4. PRESSURE REGULATOR AND TYPICAL TIE IN TO EXISTING AIR LINES ON TOP OF EACH FUME HOOD WITH TO ACTIVATE CABLE/PULLEY SYSTEM SHOWN IN FIGURE 3.

FIGURE 5. THE INFRARED SENSOR PREVENTS THE SASH FROM CLOSING ON ANY OBJECTS WITHIN THE SLIDING TRACK.

As a worker approaches a sash hood, the IR sensor opens the sash to a preset height. This allows the user to have hands free operation. When the user leaves the hood, the ASPCS closes the sash with a pre-selected time delay of 30 seconds. If an object is detected during the sash decent, the limit switch stops the sash without touching the obstruction.

- After 30 minutes, the ASPCS can be set to turn off lights inside the hood.
- An additional feature of the ASPCS is operation of the sash can be automatic or manual.
- Utility requirements for ASPCS are 120 V AC power and 20 psi of clean air with regulator.

AUTOMATED SASH POSITIONING CONTROL SYSTEM AND ENERGY CONSERVATION

According to a recent Lawrence Berkeley Laboratories study of fume hood usage, personnel are only in front of a hood 9% of the time. This means the majority of the time, hoods are left unattended and are not in use. Unless users close the sash hood, the variable air volume (VAV) exhaust valves have to remain 80-100% open to be in compliance with Cal OSHA's face velocity requirements. For an eight foot wide hood, the exhaust can reach 800-1400 cfm with the sash in the open position.

Using the ASPCS, when a user walks away from the sash hood, the hood automatically closes and the exhaust air is reduced from 800-1400 cfm to 200-300 cfm. The savings are a difference of 500-800 cfm per hood, with a corresponding reduction in kWh usage and energy demand from the central plant. Note that fume hoods must employ variable air volume systems and have vertical sashes in order to yield energy savings with an automated sash positioning control system.

IMPORTANCE OF ENERGY USAGE AND CONSERVATION TO AMGEN

As a result of rapid growth over the past few years, Amgen Inc. is very concerned about the capacity of their central plant systems to meet the energy needs within its campus. Consequently it has instituted an energy conservation policy to reduce energy usage of HVAC, gas, steam, chilled water, and electricity, whenever possible. Amgen hopes to prevent the need for additional utility construction.

Also, by conserving energy, Amgen has proven to create a safer working environment as required by the National Fire Protection Agency.

The National Fire Protection Agency has the following standards which must be met regarding Fume/Chemical Exhaust Hoods:

- NFPA Standard 45-6.8.3 Laboratory Hood Sash Closure: Laboratory hood sashes shall be kept closed whenever possible. When a fume hood is unattended, its sash shall remain fully closed.
- NFPA Standard 45A 6.8.3 – Users should be instructed and periodically reminded not to open sashes rapidly and to allow hood sashes to be open only when needed and only as much as necessary.

MONITORING AND DATA COLLECTION

During the first test, 12 sash hoods were monitored. Six hoods had automated sash positioning control systems. Of these six, three were walk-in hoods and three were modified bench top hoods -- Three walk-in hoods and three bench top hoods were also selected for the non ASPCS comparison. All hoods were 8 feet wide.

This data set was collected over a 14 day period, 24 hours a day, and in 30 minute increments from Amgen's Building Maintenance System (BMS). The data was converted from bitmap files to Excel spreadsheets by an independent company to determine average flow rates in cfm of each hood and sash position.

During test data set #2, data was also collected over a 14-day period, 24 hours a day, but the time intervals for collection were reduced to 15 minutes, which was deemed to be a more representative timeframe for testing. The Pi historian program was used to convert data from BMS to excel spreadsheets.

DATA – TEST #1

As described, the data from Test #1 was inaccurate due to obstructions. It is provided for reference in Appendix A.

DATA – TEST #2

Table 3 compares another fume hood pair -- with and without ASPCS -- over the same time period between peak and off-peak as in Test 1. An average exhaust rate was extracted daily for each time period over the 14 day test period. Whole day average is the total duration of 14 days, 24 hours per day in 15 min. increments as seen in Table 3. Sash position was monitored when hoods were in use and not in use for 2 weeks to establish a baseline load profile. There is a solid baseline at 300 cfm for all ASPCS hoods compared to a baseline at 850 cfm for hoods without ASPCS. As users close the non ASPCS hoods the required cfm drops below the base line of approximately 850 cfm and reduces down to 550-600 cfm.

Figure 6 represents exhaust rate (cfm) along the Y-axis and all data points in 15 minute increments over the 14 day test period in the X-axis. Exhaust Valve (EV)-4120_6 operates on a fume hood without an automated sash positioning control system as shown in Figure 6 as a blue line. EV-4250_4 operates on a fume hood with an automated sash positioning control system as shown in Figure 6 as a purple line.. There is a visible 500 cfm difference between the ASPCS with and without controls.

DISCUSSION

TEST 1 RESULTS

The results of the data set were unreliable and were not considered in this discussion. Additional discussion can be found in the Appendix.

RESULTS – TEST 2

Before trending the data for Test 2, Amgen made minor repairs to existing ASPCS hoods. The lower limit switch was reattached and buckets were moved outside the lower sash for the limit switches to make contact. Daily walks through the laboratories were instituted on both ground and second floors to verify all ASPCS hoods were operational and hoods without ASPCS were not intentionally closed to conserve energy. Table 4 shows a comparison of two hoods, EV-4180.4 (without ASPCS) and EV-4280.4 (with ASPCS). For this set of data (Table 4 and 7), users were partially closing the hoods without ASPCS. As a result average flow rates of between 625 and 560 cfm were observed with the control system (without ASPCS).. When users were not closing the sash (Tables 5, 6 and 8), the average exhaust (without ASPCS) increased to 800-890 cfm. For all hood with ASPCS, based on data collected, the average exhaust is about 300 cfm as described in Tables 4-8 and Figures 7-11.

The 26 California Climate Zones are shown in Figure 18. Table 9 summarizes the cost per cfm as obtained by the Trace 700 program simulations of 16 climate zones throughout California. General time of use schedules were used for on-peak, mid-peak, and off-peak periods. Amgen’s rate schedule was used to generate annual energy costs evaluating all six hoods with ASPCS and six without ASPCS controls.

CONCLUSIONS

Table 10 shows the annual energy costs, air flows with ASPCS and without ASPCS fume hoods and the costs per cfm per year. With the ASPCS, the annual utility savings will result in an approximate 2 year pay back period. The annual cost savings with ASPCS can be directly applied to the utility plant equipment. With the installation of the ASPCS, energy usage for the water chiller, chilled water pump, cooling tower, cooling tower pump, boiler, and hot water pump will also be significantly reduced.

TABLE 10. AUTOMATED SASH POSITIONING CONTROL SYSTEM (ASPCS) SAVINGS PER 1000 CFM

	328		858
	329		625
Sum Daily averages (cfm)	1960		4622
From TRACE program:			
Annual Electric Cost:	\$11,425		\$25,898
Annual Gas Cost:	\$727		\$1,360
Total Annual Utility Cost	\$12,152		\$27,258
Electric Cost per cfm/yr	\$5.83		\$5.60
Cost per 1000 cfm/yr	\$5,829		\$5,603
Gas Cost per cfm/yr	\$0.37		\$0.29
Cost per 1000 cfm/yr	\$371		\$294
Total Cost per cfm/yr	\$6.20		\$5.89
Total Cost per 1000 cfm/yr	\$6,199		\$5,893
Cost Benefit Ratio based total annual utility costs			
From the above annual utility costs		\$27,258-\$12,152 =	\$15,106
The cost to install ASPCS per fume hood is	\$4,500		
For six fume hoods the installation costs is \$4500 x 6 units = \$27,000			
\$27,000/\$15,106 =	1.79 yrs		
Simple Payback Period	1.79 yrs		

Similarly, with the reduction in air usage, the amount of chilled water and pre-heated hot water used by the air handling systems is reduced, as well. The air handling unit(s) will work at a reduced capacity. The savings for the air handling unit(s) will be a significant reduction in utility costs at the Central Plant. Future laboratory buildings will require fewer water chillers, smaller cooling towers, and less boiler capacity.

The excessive exhaust data results shown in Test 1 were not used in the data evaluation, but were critical in determining the maximum potential in cfm differences between the ASPCS and non ASPCS hoods. For example, objects can obstruct the sash from closing. Figure 19 shows chemical buckets and other obstructions that kept the lower limit switch from making contact and caused the upper sash to remain in the full open position. In this case, users were operating in manual mode leaving the upper sash partially or fully open. Figure 20 shows how obstructions were corrected by lengthening hoses and moving chemical buckets outside the lower sash. In this instance, the ASPCS could now work properly without user assistance.

FIGURE 19. CHEMICAL BUCKETS AND OTHER OBSTRUCTIONS KEEP LOWER LIMIT SWITCH FROM MAKING CONTACT

FIGURE 20. CORRECTING OBSTRUCTIONS BY LENGTHENING HOSES AND MOVING CHEMICAL BUCKETS OUTSIDE LOWER SASH. ASPCS CAN NOW WORK PROPERLY WITHOUT USER ASSISTANCE.

To help prevent obstructions from occurring and to remind users of a sash warning zone, a strip of 6-inch caution tape inside the sash hood would eliminate the potential for future obstructions of the sash. An alternative building could have been used to study the non ASPCS hoods. Normal fume hoods are left 100% open for a 24-hour day. The environment near the ASPCS hoods with personnel was very difficult to change once non ASPCS hoods were partially closed after use.

RECOMMENDATIONS

There is a definite need to install ASPCS on all hoods with variable air volumes at Amgen . Specifically for Amgen, Inc., Climate Zone 9, the cost savings are \$6.20 per cfm per year per hood. For each hood that is retrofitted with the ASPCS, a minimum difference of 550-600 cfm is realized. The cost per cfm per yr in Table 13 shows that the 16 different climate zones only ranged from \$5.79 per cfm per yr. to \$7.11 per cfm per yr.

OPTIONS FOR DETERMINING INCENTIVE REBATES

SCE has three options to consider in determining incentive rebates for reducing utility costs:

- Option #1, rebate 50% of the initial installation cost of the ASPCS or base rebates on annual cost savings from feasibility studies. For this study, 50% of the installation cost would be \$13,500 from Table 14.
- Option #2, match the annual kWh savings of \$14,473 for the six ASPCS installed as shown in Table 14. (up to maximum of 50% installed cost)
- Option #3, base a rebate on kWh savings. For Amgen, in region 9, the kWh annual usage is 185,017 kWh without ASPCS and 82,145 kWh with ASPCS. The kWh saving difference is 102,872 kWh multiplied by a rebate factor of (\$0.08/kWh) which results in \$8,230 for six ASPCS hoods or \$1,372 for each ASPCS installed.

An incentive program from SCE would reduce Amgen's simple payback period from 1.79 years to 0.94 years for options 1 and 2, 1.15 years for option 3.

APPENDIX A

Table A-1 compares a ASPCS walk-in hood and a non ASPCS walk-in hood. The off-peak period was from midnight to 6:00 a.m. The on-peak period was from 12:00 p.m. to 6:00 p.m.. Mid-Peak period was from 6:00 a.m. to 12:00 p.m. and 6:00 p.m. to midnight. An average exhaust rate was extracted daily for each time period during the 14 day test. The whole day average is the total duration of 14 days, 24 hours per day in 30 minute increments as shown in Appendix A. The remaining tables and graphs compare 5 ASPCS and five non-ASPCS hoods, as shown in the appendix material.

In Figure A-1, the Y axis represents exhaust cfm data points. In the X axis, all the data points are graphed in 30-minute increments over the 14-day test period. EV 4150.4 measures the exhaust cfm without an automated sash positioning control system and EV-4250.4 measures the exhaust cfm with ASPCS. Minor problems with first test data produced unreliable results and minimal cfm difference between both hoods. Between the two hoods, it is not obvious which hood had the ASPCS installed.

COMPARISON OF EXHAUST VALUES 4150.4 (WALK-IN FUME HOOD WITHOUT AUTOMATED SASH CONTROL) AND 4250.4 (WALK-IN FUME HOOD WITH SASH CONTROL)

In the ASPCS hood, the lower limit switch was knocked off the sash and did not make contact. The glass was cracked and the hood was manually closed by the users (425 cfm avg). Because of these problems, only a 90 cfm difference was observed between the ASPCS (515 cfm avg) and non ASPCS (425 cfm avg). Results are provided in Table A-2 and Figure A-2.

TABLE A-1. COMPARISON OF CFMs FOR EXHAUST VALVE 4150.4 WITHOUT AUTOMATED SASH CONTROLS AND EXHAUST VALVE 4250.4 WITH AUTOMATED SASH CONTROLS

VALVE #	4150.4	4250.4	WALK-IN
	Without ASPCS	With ASPCS

On-Peak	577	551	26
Mid-Peak	520	406	113
Whole Day Avg	515	425	89

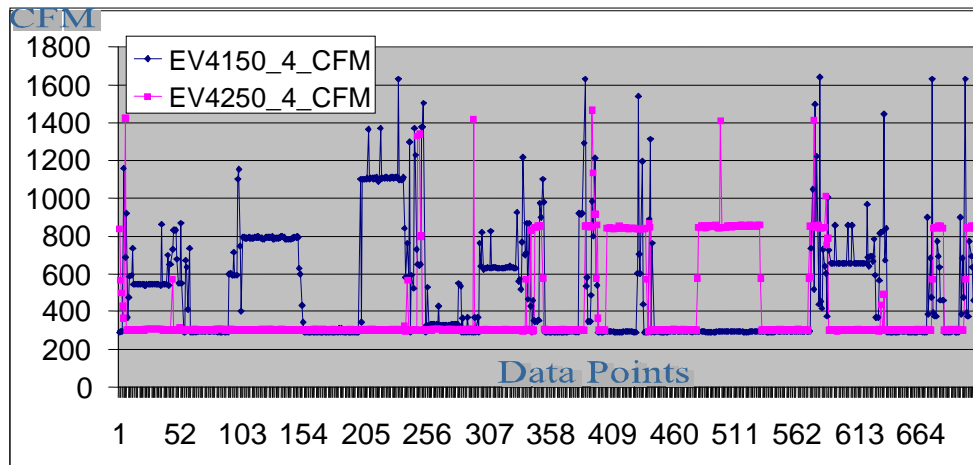

FIGURE A-1. COMPARISON OF TEST RESULTS FOR EXHAUST VALVE 4150.4 WITHOUT AUTOMATED SASH CONTROLS AND EXHAUST VALVE

COMPARISON OF EXHAUST VALUES EV 4280.6 (MODIFIED BENCH-TOP FUME HOOD WITHOUT AUTOMATED SASH CONTROL) AND EV 4120.4 (MODIFIED BENCH-TOP FUME HOOD WITH AUTOMATED SASH CONTROL)

There was a 350 cfm difference between the non-ASPCS and the ASPCS fume hood as shown in Table A-2 and Figure A-2. The ASPCS installed hood was working properly (304 cfm avg.), but the users were partially closing the non ASPCS hood (654 cfm avg.) as a result of a visible campaign sign to conserve energy (Figure A-4).

TABLE A-2. COMPARISON OF TEST RESULTS FOR EXHAUST VALVES 4280.6 & 4120.4

VALVE #	4280.6	4120.4	BENCHTOP
Time Period	CFM Without ASPCS	CFM With ASPCS	CFM Difference
Off-Peak	635	295	340
On-Peak	683	330	353
Mid-Peak	653	301	353
Whole Day Avg	654	304	350

FIGURE A-3. AMGEN'S AWARENESS CAMPAIGN TO CONSERVE ENERGY. THIS SIGNAGE WAS APPLIED TO ALL VAV HOODS.

COMPARISON OF EXHAUST VALUES EV 4250.6 (MODIFIED BENCH-TOP FUME HOOD WITHOUT AUTOMATED SASH POSITIONING CONTROL SYSTEM) AND EV 4150.6 (MODIFIED BENCH-TOP FUME HOOD WITH AUTOMATED SASH CONTROL)

A comparison between these non-ASPCS and ASPCS modified benchtop hoods yielded a 283 cfm difference between the hoods as shown in Table A-4 and Figure A-4. Results were very similar to the results in Table 1. The ASPCS installed hood was working properly (294 cfm avg.), but the users were again partially closing the non ASPCS hoods (577 cfm avg.).

TABLE A-3. COMPARISON OF EXHAUST VALVES 4250.6 WITHOUT ASPCS AND EXHAUST VALVE 4150.6 WITH ASPCS

VALVE #	4250.6	4150.6	BENCHTOP
Time Period	CFM Without ASPCS	CFM With ASPCS	CFM Difference
Off-Peak	552	289	263
On-Peak	683	314	369
Mid-Peak	555	289	265
Whole Day Avg	577	294	283

FIGURE A-4. COMPARISON OF EXHAUST VALVES 4250.6 WITHOUT ASPCS AND EXHAUST VALVE 4150.6 WITH ASPCS

The ASPCS hood was working correctly, but there was an empty bottle obstruction restricting the sash from fully closing (407 cfm avg).as shown in Figure A-5. Both hoods have comparable cfm usage with a 118-cfm difference in usage as shown in Figure A-5. The non-ASPCS hood also has lower readings (524 cfm) due to users partially closing the sash.

FIGURE A-5. ASPCS HOOD 4150.6 WITH EMPTY BOTTLE OBSTRUCTION CAUSING EXCESSIVE EXHAUST USAGE.

COMPARISON OF EXHAUST VALVES EV 4220.6 (WALK IN FUME HOOD WITHOUT AUTOMATED SASH POSITIONING CONTROL SYSTEM) AND EV 4210.6 (WALK IN FUME HOOD WITH AUTOMATED SASH POSITIONING CONTROL SYSTEM)

A comparison of these two hoods shown in Table A-5 and Figure A-7 gives a negative difference in cfm readings. An ASPCS hood as a rule uses less exhaust than a non-ASPCS hood. Because the lower limit switch did not make contact with the ASPCS hood, the upper sash remained open during data testing, resulting in an error reading of -301 cfm avg. The ASPCS hood used 685 cfm avg exhaust while again the non-ASPCS hood was partially close showing only 384 cfm avg exhaust.

TABLE A-5 COMPARISON OF EXHAUST VALVES 4220.6 WALK-IN FUME HOOD WITHOUT AUTOMATED SASH POSITIONING CONTROL SYSTEM AND EXHAUST VALVE 4210.6 WITH AUTOMATED SASH POSITIONING CONTROL SYSTEM.

VALVE #	4220.6	4210.6	WALK-IN
Time Period	CFM Without ASPCS	CFM With ASPCS	CFM Difference
Off-Peak	361	681	-321
On-Peak	410	693	-283
Mid-Peak	386	684	-298
Whole Day Avg	384	685	-301

FIGURE A-7. COMPARISON OF EXHAUST VALVES 4220.6 WALK-IN FUME HOOD WITHOUT AUTOMATED SASH POSITIONING CONTROL SYSTEM AND EXHAUST VALVE 4210.6 WITH AUTOMATED SASH POSITIONING CONTROL SYSTEM.

COMPARISON OF EXHAUST VALVES EV 4180.4 (WALK-IN HOOD WITHOUT AUTOMATED SASH POSITIONING CONTROL SYSTEM) AND EV 4280.4 (WALK-IN FUME HOOD WITH AUTOMATED SASH POSITIONING CONTROL SYSTEM)

Table A-6 and Figure A-8 compare walk-in hoods EV 4180.4 (without ASPCS) and 4280.4 (with ASPCS).

The non-ASPCS hood was partially opened with the light turned off (480 cfm average) instead of fully opened. We believe that the hood was rarely in use. Because of this error, data was used from a replacement walk-in hood as observed in test data #2. The ASPCS hood was working correctly in that case and was in use (352 cfm average). The resulting difference between the two hoods was 136 cfm average.

The results from the first data set was reviewed by Amgen, SCE representatives, and Harris Group Engineers. The group recommended that a second data set be collected to study the potential savings of the ASPCS with increased accuracy.

During teleconferences involving SCE, Amgen, and Harris Group, shorter time intervals for readings were agreed to on the hood positions. The appendix has print outs of the six ASPCS hoods with 5-minute increments. There were no appreciable differences in average cfm usage when compared to 30 minute increments. Because of this, for the second set of data, the increments were reviewed at 15 minute intervals.

SYSTEM SUMMARY

DESIGN AIRFLOW QUANTITIES

By Harris Group Inc.

MAIN SYSTEM

System Description	System Type	MAIN SYSTEM			Auxiliary System		Room	
		Outside Airflow cfm	Cooling Airflow cfm	Heating Airflow cfm	Return Airflow cfm	Exhaust Airflow cfm	Supply Airflow cfm	Exhaust Airflow cfm
System - 001	Fan Coil	1,960	1,960	1,960	1,960	0	0	1,960
Totals		1,960	1,960	1,960	1,960	0	0	1,960

Note: Airflows on this report are not additive because they are each taken at the time of their respective peaks. To view the balanced system design airflows, see the appropriate Checksums report (Airflows section).

SYSTEM SUMMARY DESIGN COOLING CAPACITIES

By Harris Group Inc.

Building Airside Systems and Plant Capacities

Peak Plant Loads

Plant System	Peak Plant Loads										Time Of Peak mo/hr	Block Plant Loads									
	Main Coil ton	Aux Coil ton	Opt Vent Coil ton	Misc Load ton	Stg 1 Desic Cond ton	Stg 2 Desic Cond ton	Base Utility ton	Peak Total ton	Main Coil ton	Aux Coil ton		Opt Vent Coil ton	Misc Load ton	Stg 1 Desic Cond ton	Stg 2 Desic Cond ton	Base Utility ton	Block Total ton				
Chiller System - 001	8.7	0.0	0.0	0.0	0.0	0.0	8.7	5.4	0.0	0.0	0.0	0.0	0.0	0.0	0.0	5.4
